PROVISION MONTH-END AUTOMATION

User Guide — How to Calculate the Meal Rate

01	START	02	IMPORT	03	COUNT	04	RESULT
	Set month & meals		Previous report + provisions		Enter physical ROB		Generate & check rate

What this workbook does

The workbook calculates the monthly meal rate from **Beginning Stock + Provisions Received** – **Physical Closing Stock**. It then calculates the total consumption cost and divides it by the total number of meals.

1 Open the Workbook & Set the Reporting Month

Complete the basic setup before importing any stock or delivery information.

1 **Open the Provision Month-End Automation workbook.**
If Excel asks you to enable macros, click **Enable Content**. The workbook will then be ready to use.

2 **Go to START HERE.**
Enter the month you are preparing in **Reporting Month**. Example: **September 2026**.

> **START HERE is your main result page**
>
> You will return here at the end of the process to check the final **Daily Rate (USD)**.

2 Import the Previous Month Report

This brings the previous closing quantities into the current month.

1 **Go to the CONTROL sheet.**
Click **Import Previous Month**.

2 **Select the previous month company Stock Report.**
The system automatically brings in the previous closing quantities and item information.

> **No manual item copying required**
>
> You do not need to manually copy the items from the previous report.

IMPORTANT: Check the Closing Inventory Columns

When importing last month?s provision file, make sure CLOSING INVENTORY uses columns V, W and X, as shown in the example.

If necessary, add or remove columns in the PURCHASE AREA to adjust the layout so CLOSING INVENTORY is in columns V:X.

If these columns are not correctly positioned, the Stock Report may not generate.

	V	W	X
	CLOSING INVENTORY		
	QTY.	UNIT COST	TOTAL COST
			USD
3	10.00	2.11	21.12
1	5.00	12.80	63.98

3 Import Provision / Delivery Files

All provision deliveries received during the reporting month can be brought into the workbook.

1. **On the CONTROL sheet, click Import Provision Files.**
   Select all provision delivery files received during the month.
2. **Select one or several delivery files.**
   You can import **one, two, or several** delivery files.
3. **Allow the system to combine the deliveries.**
   The system automatically combines the received quantities for each **OCL/V Code**.

> **Multiple deliveries are supported**
>
> You do not need to combine the delivery files manually before importing them.

4 Enter Currency Rates

Currency rates are required when provisions are received in currencies other than USD.

1. **During provision import, enter the currency rate when requested.**
   Normally, the system asks for the currency rate automatically when a provision file is imported.
2. **Use the CURRENCY RATES sheet.**
   Enter the **USD value of 1 unit of the currency**.

> **Example — LKR**
>
> If **1 USD = 300 LKR**, enter **0.003333333** for LKR. USD is already set as **1.0000**.

5 Enter Party / Event Costs

Use this section when food was used for a party, event, or another special purpose and the cost must be excluded from normal crew consumption.

1 **Go to PARTIES.**
Enter the **Date**, **Party / Event**, **Cost**, and **Currency**.

2 **Allow the system to convert the cost.**
The system converts the cost to USD and deducts it from normal consumption cost.

> **If there is no party cost**
>
> Nothing needs to be entered. The party cost remains **0**.

6 Enter Total Meals

The total meal count directly affects the final meal rate.

1 **Go back to START HERE.**
Enter the total number of meals in **Meals**.

> **Example**
>
> If the reporting period contains **1,850 meals**, enter **1,850**. Make sure this number is correct because it directly affects the final meal rate.

7 Take the Physical Stock Count

At the end of the month, physically count the remaining provisions onboard.

1 **Use the PHYSICAL COUNT sheet as the counting list.**
Export the Physical Count Sheet using the **Export** button and choose **Export as Excel**.

2 **Count the actual remaining quantity onboard for each item.**
Fill the exported Physical Count Sheet with the physical quantities.

8 Import the Physical Count & Generate the Report

Bring the completed physical count back into the workbook before generating the month-end report.

1. **Fill the exported Physical Count Sheet.**
   Enter the actual remaining quantity onboard for each item.
2. **Import the completed sheet again.**
   All filled physical-count data will be imported into the system.
3. **Review the Meal Rate.**
   You can make adjustments in the **Physical Count** sheet inside the workbook if required.
4. **Check PHYSICAL COUNT → Physical ROB.**
   The system calculates consumption automatically.

CONSUMPTION QUANTITY	=	Beginning Quantity + Received Quantity – Physical Closing Quantity

9 Generate the Month-End Report

Before generating the report, complete all required inputs.

✓	Previous month import
✓	Provision imports
✓	Currency rates
✓	Party costs, if applicable
✓	Total meals
✓	Physical stock count

Final action

Go to the **CONTROL** sheet and click **Generate Month-End Report**. The system calculates the month-end consumption and prepares the final Stock Report.

10 Get the Meal Rate

The final result is displayed on START HERE.

DAILY RATE (USD)

USD 4.25

Example final meal rate

How the Meal Rate Is Calculated

Calculation

Net Consumption Cost ÷ Total Meals = Meal Rate

Net Consumption Cost = Total Consumption Cost – Party/Event Cost

Item	Example
Total Consumption Cost	USD 8,500
Party Cost	USD 500
Net Consumption Cost	USD 8,000
Total Meals	900
Meal Rate	USD 8.89 per day

Monthly User Checklist

■	Reporting Month entered
■	Previous Month Report imported
■	All Provision Files imported
■	Currency rates entered where required
■	Party/Event costs entered, if applicable
■	Total Meals entered
■	Physical ROB counted and entered
■	Generate Month-End Report clicked
■	Final Daily Rate (USD) checked on START HERE

Important

> The user normally only needs to work with: **START HERE** → **CONTROL** → **PHYSICAL COUNT** → **PARTIES** → **CURRENCY RATES**.
> The calculation sheets are automatic and normally do not require manual editing.
>
> The main result you need is: **START HERE** → **Daily Rate (USD)**. That is the final monthly meal rate.
